In this project we were supposed to take an input from the user ,just like in the linux terminal, and parse it so we could use the keywords as options of the script. I personaly did the parsing part but haven used it in my scripts since it was not easy for me to figure out the creative scripts and the ones I could figure didn't need them (only one of them does).

EASY SCRIPT -WORKSPACE
opens the selected apps (currently stackoverflow url,mefblacboard url and geany app)

MEDIUM SCRIPT-GREET

greets the user in the input for example "greet EMRE" uses the parsed word as variable and shows minimalistic weather in the area and the local date of the computer.
I would like to add a random quote every day kinda thing to the script but couldn't get the material I needed in time so I didn't do it

HARD SCRIPT-NEWSPAPER

this script generates a .txt file with the name of newspaper dd_mm (whatever the current date is). In the .txt file it starts with the date (like normal newspapers do), the black&white version of the weather report (colors didn't get carried and got corrupted when importing to .txt, otherwise I'd do a better and bigger weather broadcast), name of the newspaper (used an extension namet figlet for the font.) and finally the hardest thing for me, it has the news section which gets the news from an online/active site 'http://lite.cnn.io/en' this is the text only version of the cnn site. I used it because it had a clearer HTML than other news sites but still it had pretty much meaningless characters on it when I first tried so I had to try many methods to finally print it this way (they are in the script commented out for your interest).

ALIAS

I did the alias script as I could but couldn't make it work and didn't wanted to take help from any friends since the last automata accident. The script exists but it isn't called in the code.
